

diffchecker-inhouse

Internal diff-checker for CSV comparison

Repo: <https://github.com/zoeydn/diffchecker-inhouse>

Getting Started

1. **Open the app:** Double-click `index.html` in your web browser
2. **Upload your two CSV files** using the "Upload File" buttons
3. **Choose a compare mode** (see below) and click "**Compare Documents**"
4. **Resolve differences:** For each difference, pick CSV 1, CSV 2, or enter custom text
5. **Export:** Click "**Export Final Transcript**" to download the merged CSV

Compare Modes

Compare Full CSV

Compares every column in both files at once. Use this when you want to diff the entire file without any filtering.

Choose Columns

Lets you pick which columns to compare. Use this when your CSVs have many columns but you only care about specific ones.

- A column picker shows preview content from each column so you can identify the right ones
- Empty columns are automatically hidden
- Use Select All / Deselect All for quick selection
- After viewing results, click "Show Columns" to change your selection

Features

- **Cell-by-cell comparison** with row and column location for each difference (e.g., "Row 2 — Q11:")
- **Word-level diff highlighting:** red for CSV 1 text, green for CSV 2 text
- **Smart code filtering:** Removes bracketed codes when comparing
 - Preserves interviewer tags like `[INT:]` and `[Interviewer:]`
 - Strips tags but keeps content: `[FEL: scared]` → `scared` , `[NAR: text here]` → `text here`
 - Toggle "Show cleaned text" to switch between original and cleaned views
- **Interactive resolution:** Pick CSV 1, CSV 2, or type custom text for each difference
 - Bulk selection with Select All Left / Select All Right
- **Export to CSV:** Merged output named with the current date (e.g., `merged-csv-2025-01-22.csv`)

Export Warnings

When you export, the app checks for issues in this order:

1. **Unresolved differences:** Any row differences in compared columns you didn't resolve are marked as `[UNRESOLVED]` in the output
2. **Non-compared columns** (Choose Columns mode only): If columns you didn't compare have differences, warns you which columns and lets you cancel or continue. If you continue, those cells

are also marked as `[UNRESOLVED]` in the export

Unchanged content is always included automatically in the final output.

Tips

- **Show cleaned text:** Check the box to hide `[FEL:]` , `[NAR:]` , and similar codes when viewing differences
- **Load samples:** Use the "Load Sample" buttons to try the tool with example data
- **Duplicate file warning:** The app warns you if you upload the same file to both panels
