

diffchecker-inhouse

Internal diff-checker for CSV comparison

Features

- **CSV cell-by-cell comparison:** Compares each cell individually
 - Shows row and column location for each difference
 - Exports merged result as CSV
- **Word-level diff highlighting:** Highlights exactly which words changed within each cell
 - Red highlight: text in CSV 1
 - Green highlight: text in CSV 2
- **Smart code filtering:** Automatically removes bracketed codes when comparing
 - Preserves `[INT:]` , `[Interviewer:]` and similar interviewer tags
 - Removes tags but keeps content: `[FEL: scared]` → `scared` , `[NAR: text here]` → `text here`
 - Toggle to view original or cleaned text in the interface
- **Interactive difference resolution:**
 - Radio button selection to choose from CSV 1 or CSV 2
 - Manual text input field for custom edits
 - Bulk selection (Select All Left/Right)
- **Export functionality:** Generate a final merged CSV

Getting Started

1. **Open the app:** Double-click `index.html` in your web browser
2. **Upload or paste** your two CSV files:
 - Click "Upload File" to select a .csv file
3. Click "**Compare Documents**" to see the differences
4. For each difference, choose:
 - **Left option** (CSV 1)
 - **Right option** (CSV 2)
 - Or **enter custom text** manually
5. Click "**Export Final Transcript**" to download your merged CSV

How It Works

1. Parses both CSV files into rows and columns
2. Compares each cell at matching positions
3. Shows differences with row/column location (e.g., "Row 2 — Q11:")
4. Exports merged CSV with your selections

Usage Tips

- **Toggle display:** Use "Show cleaned text (remove codes) in differences" checkbox to switch between viewing original vs cleaned text
- **Load samples:** Click "Load Sample" buttons to test with example data
- **Unresolved differences:** Warning popup lists all unresolved items (with row/column) before export. Unresolved items are marked as `[UNRESOLVED]` in the output
- **Unchanged content:** Automatically included in the final output

- **Export naming:** Files are named with the current date (e.g., `merged-csv-2025-01-22.csv`)
